

Pós -graduação Ciência de Dados – PUC Rio
Sprint 3 – Engenharia de Dados
Aluno: Frederico Araújo Soares

Objetivo

Este trabalho tem como resultado, a criação de algumas tabelas referentes a dados de chuva/precipitação da cidade de Goiânia – GO.

O Pipeline irá ser executado para carregar os dados tratados em algumas tabelas no serviço da cloud do Google, serviço chamado BigQuery.

O objetivo deste trabalho é finalizar o pipeline para disponibilizar os dados em algumas consultas para responder as seguintes perguntas:

- É possível identificar eventos extremos com picos de precipitação, temperaturas ou rajadas de ventos?
- Investigar como a radiação solar influencia outras variáveis como temperatura e umidade.

Detalhe dos dados

O dados serão obtidos no sítio eletrônico do INMET (<https://portal.inmet.gov.br/dadoshistoricos>). Em seguida será realizado um tratamento para obter somente os dados de Goiânia.

Fluxo de execução do Pipeline

Será executado um Notebook dentro do BigQuery chamado “mvp3-engenharia-dados-coleta-dados.ipynb”. Este notebook está presente nos arquivos aqui deste repositório github. Os seguintes passos serão executados:

1. Coleta dos dados
2. Extração e seleção do csv de Goiânia
3. Tratamento para dados faltantes
4. Upload para o Google Cloud Storage (bucket) dos dados atuais processados e histórico dos dados executados.
5. Carregamento dos dados nas tabelas do BigQuery
6. Apresentação dos dados no BigQuery e Power BI Desktop

Configuração da Infraestrutura

Criação do Projeto

Primeiramente é necessário criar o projeto no Google Cloud. No caso criei um projeto chamado MVP-data-engineer-v1.

Criação do storage (bucket):

MVP-data-engineer-v1

Search (/) for resources

Create a bucket

- Name your bucket**
Pick a globally unique, permanent name. [Naming guidelines](#)
mvp-data-engineer-v1
Tip: Don't include any sensitive information
LABELS (OPTIONAL)
CONTINUE
- Choose where to store your data**
Location: us (multiple regions in United States)
Location type: Multi-region
- Choose a storage class for your data**
Default storage class: Standard
- Choose how to control access to objects**
Public access prevention: On
Access control: Uniform
- Choose how to protect object data**
Soft delete policy: Enabled
Object versioning: Disabled
Bucket retention policy: Disabled
Object retention: Disabled
Encryption type: Google-managed

CREATE CANCEL

Detalhes do bucket:

Pipeline Google Cloud Data Fusion

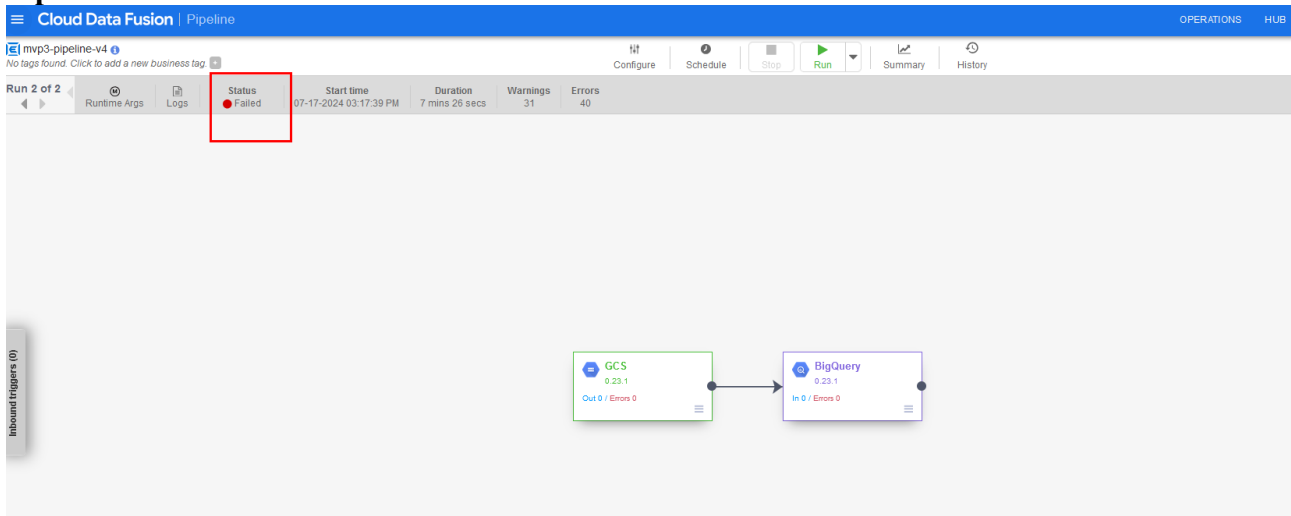

Foi criado inicialmente um pipeline com o Fusion, porém não consegui identificar a tempo um erro de transformação dos dados do CSV para a tabela do BigQuery.

Após criar a instância do Fusion, clique para visualizar a instancia:

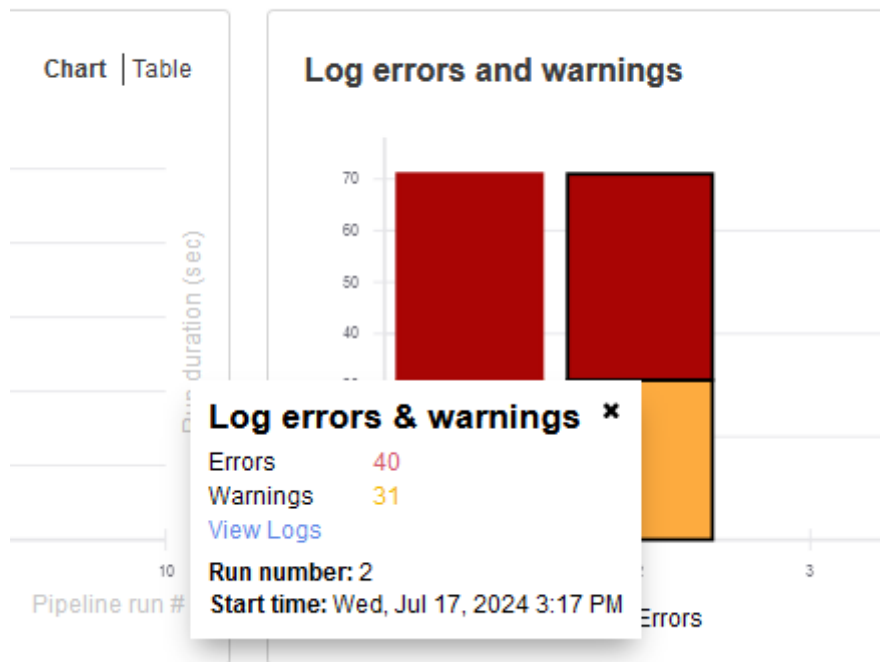

Foi criado o pipeline simples do bucket para a tabela no BigQuery, porém, apresentou erros de formatação. Como o prazo final já estava perto, preferi criar o pipeline com o notebook. A seguir as telas do pipeline e os erros:

Modelo dos dados via PowerBI

Criação no BigQuery das Tabelas

O arquivo mvp3_ddl.sql possui o sql de criação das tabelas.

Aqui é importante ressaltar as limitações do BigQuery. As chaves primárias e estrangeiras são “not enforced” de acordo com a documentação:

<https://cloud.google.com/bigquery/docs/information-schema-table-constraints#limitations>

SOLUÇÃO: Analisando se as perguntas dos objetivos foram atendidas

- É possível identificar eventos extremos com picos de precipitação, temperaturas ou rajadas de ventos?

Resposta via BigQuery:

mvp3-en... ynb × *mvp3-sol...nal × investiga...cao × mvp3_ev...mos ×

mvp3_eventos_extremos RUN DOWNLOAD SHARE SCHEDULE MORE SAVE QUERY This query will proc

```
1 --Identificar eventos meteorológicos extremos, como picos de precipitação, temperaturas extremas, altas rajadas de vento, etc.
